For two strings A and B, we define the similarity of the strings to be the length of the longest prefix common to both strings. For example, the similarity of strings "abc" and "abd" is 2, while the similarity of strings "aaa" and "aaab" is 3.

Calculate the sum of similarities of a string S with each of its suffixes.

Input Format

The first line contains the number of test cases t.

Each of the next t lines contains a string to process, s.

Constraints

- $1 \leq t \leq 10$
- $1 \leq |s| \leq 100000$
- s is composed of characters in the range `ascii[a-z]`

Output Format

Output t lines, each containing the answer for the corresponding test case.

Sample Input

```
2
ababaa
aa
```

Sample Output
