Problem | Submissions | Leaderboard | Discussions | Editorial | Topics

Given a string of lowercase letters in the range `asciia-z`, determine the index of a character that can be removed to make the string a **palindrome**. There may be more than one solution, but any will do. If the word is already a palindrome or there is no solution, return -1. Otherwise, return the index of a character to remove.

Example

`s = "bcbcb"`

Either remove 'b' at index 0 or 'c' at index 3.

Function Description

Complete the `palindromeIndex` function in the editor below.

`palindromeIndex` has the following parameter(s):

- string `s`: a string to analyze

Returns

- int: the index of the character to remove or -1

Input Format

The first line contains an integer `q`, the number of queries.

Each of the next `q` lines contains a query string `s`.

Constraints

- $1 \leq q \leq 20$
- $1 \leq \text{length of } s \leq 10^6 + 5$
- All characters are in the range `asciia-z`.
