890. Find and Replace Pattern

Medium Topics Companies

Given a list of strings `words` and a string `pattern`, return a list of `words[i]` that match `pattern`. You may return the answer in **any order**.

A word matches the pattern if there exists a permutation of letters `p` so that after replacing every letter `x` in the pattern with `p(x)`, we get the desired word.

Recall that a permutation of letters is a bijection from letters to letters: every letter maps to another letter, and no two letters map to the same letter.

Example 1:

Input: words = ["abc","deq","mee","aqq","dkd","ccc"], pattern = "abb"
Output: ["mee","aqq"]
Explanation: "mee" matches the pattern because there is a permutation {a -> m, b -> e, ...}.
"ccc" does not match the pattern because {a -> c, b -> c, ...} is not a permutation, since a and b map to the same letter.

Example 2:

Input: words = ["a","b","c"], pattern = "a"
Output: ["a","b","c"]

Constraints:

- 1 <= pattern.length <= 20
- 1 <= words.length <= 50
- words[i].length == pattern.length

Code

Java Auto

```
1 import java.util.*;
2
3 class Solution {
4
5     public List<String> findAndReplacePattern(String[] words, String pattern) {
6
7         List<String> result = new ArrayList<>();
8
9         for (String word : words) {
10
11             if (matches(word, pattern)) {
12                 result.add(word);
13             }
14         }
15     }
```
