Editorial

Given a time in **12-hour AM/PM format**, convert it to military (24-hour) time.

Note: - 12:00:00AM on a 12-hour clock is 00:00:00 on a 24-hour clock.

- 12:00:00PM on a 12-hour clock is 12:00:00 on a 24-hour clock.

Example

- `s = '12:01:00PM'`

Return '12:01:00'.

- `s = '12:01:00AM'`

Return '00:01:00'.

Function Description

Complete the `timeConversion` function with the following parameter(s):

- `string s`: a time in 12 hour format

Returns

- `string`: the time in 24 hour format

Input Format

A single string `s` that represents a time in 12-hour clock format (i.e.: `hh:mm:ssAM` or `hh:mm:ssPM`).

Constraints

- All input times are valid

283. Move Zeroes

Easy Topics Companies Hint

Given an integer array `nums`, move all `0`'s to the end of it while maintaining the relative order of the non-zero elements.

Note that you must do this in-place without making a copy of the array.

Example 1:

Input: `nums = [0,1,0,3,12]`

Output: `[1,3,12,0,0]`

Example 2:

Input: `nums = [0]`

Output: `[0]`

Constraints:

- $1 \leq \text{nums.length} \leq 10^4$
- $-2^{31} \leq \text{nums}[i] \leq 2^{31} - 1$

Follow up: Could you minimize the total number of operations done?

4
5         // Move all non-zero elements to the front
6         for (int i = 0; i < nums.length; i++) {
7             if (nums[i] != 0) {
8                 nums[insertPos] = nums[i];
9                 insertPos++;
10            }
11        }
12
13        // Fill the remaining positions with zeros
14        while (insertPos < nums.length) {
15            nums[insertPos] = 0;
16            insertPos++;
17        }
18    }
19 }
