

## 724. Find Pivot Index

Easy Topics Companies Hint

Given an array of integers `nums`, calculate the **pivot index** of this array.

The **pivot index** is the index where the sum of all the numbers **strictly** to the left of the index is equal to the sum of all the numbers **strictly** to the index's right.

If the index is on the left edge of the array, then the left sum is `0` because there are no elements to the left. This also applies to the right edge of the array.

Return the **leftmost pivot index**. If no such index exists, return `-1`.

### Example 1:

**Input:** `nums = [1,7,3,6,5,6]`  
**Output:** `3`  
**Explanation:**  
The pivot index is 3.  
Left sum = `nums[0] + nums[1] + nums[2] = 1 + 7 + 3 = 11`  
Right sum = `nums[4] + nums[5] = 5 + 6 = 11`

### Example 2:

**Input:** `nums = [1,2,3]`  
**Output:** `-1`  
**Explanation:**  
There is no index that satisfies the conditions in the problem statement.

### Example 3:

**Input:** `nums = [2,1,-1]`  
**Output:** `0`  
**Explanation:**  
The pivot index is 0.  
Left sum = `0` (no elements to the left of index 0)  
Right sum = `nums[1] + nums[2] = 1 + -1 = 0`

### Code

Java Auto

```
1 class Solution {
2     public int pivotIndex(int[] nums) {
3         int total = 0;
4
5         // Calculate total sum
6         for (int num : nums) {
7             total += num;
8         }
9
10        int leftSum = 0;
11
12        for (int i = 0; i < nums.length; i++) {
13            // Right sum = total - left sum - current element
14            int rightSum = total - leftSum - nums[i];
15
16            if (leftSum == rightSum) {
17                return i;
```
